### Course Description

---

This 5-day course explores the development opportunities with SharePoint Server 2016 product. The first half of the class focuses on SharePoint Foundation 2016 development where students will learn how to develop fundamental building blocks such as features, solutions, pages, lists and workflows. In addition, new topics such the new SharePoint app model and the SharePoint app security (OAuth and S2S) for apps as well as remote event receivers are covered and explained in great depth.

The second half of the class addresses SharePoint Server 2016 service applications which provide additional enterprise development opportunities such as working with Business Connectivity Services, Enterprise Content Management, Web Content Management, search and other services specific to SharePoint Server 2016.

Some non-SharePoint topics are also covered that are heavily leveraged within SharePoint such as OData, Office 365, OAuth, JavaScript, JavaScript templates and Windows Azure so those students with little to no experience in these areas will get an adequate ramp-up to be productive in SharePoint 2016.

Throughout the course students will not only learn how to create robust project and solutions using the tools included in Visual Studio 2015, but they will also learn best practices about what and when you should and should not do.

### Student Prerequisites

---

Attendees should have professional development experience with Visual Studio, JavaScript, C# the .NET Framework and ASP.NET. It is also recommended (but not required) that attendees have a background with the previous version of SharePoint Server .
